

IMPERMEABILIZACIÓN DE TECHOS CON ENVASES *TETRA PAK*

Una alternativa barata y eficaz para aislar techos y paredes es el uso de envases de leche u otros líquidos, conocidos como *tetra pak*. Estos envases, absolutamente impermeables, se elaboran con cartón, plástico y aluminio, lo que impide que puedan reciclarse.

Al utilizarlos en la construcción no sólo disponemos de un aislante de bajo costo, sino que le damos un uso a algo que de otro modo terminaría incrementando el volumen de la basura.

ROOF WATERPROOFING WITH TETRA PAK CONTAINERS

An inexpensive and effective alternative for the insulation of roofs and walls is the use of milk cartons, and other liquid containers, known as tetra pak. These cartons, absolutely impermeable, are made of cardboard, plastic, and aluminum, which makes them difficult to recycle.

By using these materials for construction, we not only make available a low-cost form of insulation, but also make use of something that would otherwise end up increasing the amount of garbage.
